

EATOBIOTICS GUT INTELLIGENCE

The Food System Inside You

EMERGING BALANCE

Your gut system is developing real momentum — you have genuine strengths to build on and clear levers to pull.

Your food system is further along than most. A score of 68 places you in the top third of people who take this assessment, and your Prebiotics and Postbiotics scores are particularly strong. The opportunity ahead is focused and specific: your Probiotics score is the single biggest gap, and closing it will lift everything else.

Emerging Balance

YOUR GUT PROFILE

Emerging Balance

Genuine positive habits are forming, but key biological inputs are still inconsistent. The foundation exists — it

needs specific additions.

- Some plant food variety
- Irregular fermented food intake
- Partial gut rhythm established
- Specific gaps to close

NEXT LEVEL — STRONG FOUNDATION

A well-functioning gut with real momentum. The structural habits are in place and the microbiome is being actively supported. Your 30-day plan is designed to close the gap between where you are now and this next tier.

— YOUR THREE BIOTICS —

Prebiotics · Probiotics · Postbiotics

The three biological pillars of your gut food system — each scored independently.

PREBIOTICS

72 Strong

Your plant diversity and fibre intake are solid. You're regularly including a good range of vegetables, legumes, and whole grains — this is the foundation your microbiome feeds on.

PROBIOTICS

45 Your gap

Your intake of fermented and probiotic-rich foods is your biggest gap. You rarely consume foods like kefir, yoghurt, kimchi, or miso — the living foods that actively introduce bacterial diversity.

POSTBIOTICS

78

Strong

Your gut shows good recovery patterns. Your meal timing is relatively consistent, and you're not reporting significant digestive discomfort — signs that your gut lining and rhythm are in reasonable shape.

— YOUR PATTERN

What your score means

A score of 68 reflects a gut system that functions reasonably well day-to-day but is operating below its potential. You eat a good variety of plant foods (Prebiotics: 72) and your body shows signs of recovery and rhythm (Postbiotics: 78), but your intake of fermented and probiotic-rich foods is noticeably low (Probiotics: 45). This creates a one-sided system — you're feeding the microbiome but not actively seeding it with the bacterial diversity it needs to thrive. The good news is that Probiotics is the most responsive pillar to targeted dietary change. Small, consistent additions can produce measurable shifts within 2–4 weeks.

What this means for you every day

Your scores translate directly into how you feel, function, and recover — day to day.

Energy levels

Your mid-afternoon energy dip is directly linked to your Probiotics gap. A low-diversity microbiome produces less butyrate — the short-chain fatty acid that stabilises blood sugar and sustains energy between meals.

Digestive comfort

Occasional bloating or sluggish digestion after meals is a common signal of an under-seeded gut. Adding fermented foods reduces this noticeably within 2–3 weeks for most people.

Sleep quality

Your gut produces 90% of your body's serotonin — the precursor to melatonin. A stronger Probiotics score means better serotonin production, better melatonin, and deeper sleep.

How your scores connect to how you feel

Each symptom below is directly linked to one or more of your pillar scores. Highlighted symptoms are most likely affecting you based on your results.

Brain fog & poor focus

LIKELY AFFECTING YOU

Low microbial diversity reduces butyrate production, which crosses the blood-brain barrier and impairs cognitive clarity and recall speed.

VIA Pro 45 Pos 78

Afternoon energy crash

LIKELY AFFECTING YOU

An under-seeded gut destabilises blood sugar between meals. Less butyrate means less stable energy — the 3pm dip is a gut signal.

VIA Pro 45 Pre 72

Bloating after meals

LOW RISK

Insufficient fibre variety creates imbalanced fermentation. The wrong bacterial species produce gas rather than beneficial short-chain fatty acids.

VIA Pre 72 Pos 78

Poor sleep quality

LIKELY AFFECTING YOU

90% of serotonin — the direct precursor to melatonin — is produced in the gut. Low Probiotics directly reduces sleep onset speed and deep-sleep duration.

VIA Pro 45

Mood instability

LIKELY AFFECTING YOU

The vagus nerve carries gut signals directly to the brain. A disrupted microbiome generates inflammatory

Slow recovery

LOW RISK

Short-chain fatty acids produced by the gut are essential for reducing systemic inflammation after physical or cognitive stress.

signals that destabilise mood baseline.

VIA **Pro 45** **Pos 78**

VIA **Pos 78**

Frequent illness

LIKELY AFFECTING YOU

70% of immune cells reside in the gut lining. Low prebiotic and probiotic intake weakens the mucosal barrier that keeps pathogens out.

VIA **Pre 72** **Pro 45**

Sugar & junk cravings

LIKELY AFFECTING YOU

Opportunistic bacteria that thrive on sugar send signals via the vagus nerve creating cravings for the ultra-processed foods that sustain them.

VIA **Pre 72** **Pro 45**

90%

of your serotonin is produced in your gut — not your brain

The bacteria in your gut synthesise the neurotransmitters that regulate your mood, sleep quality, and mental clarity. Your Probiotics score is the single strongest dietary lever for this production.

YOUR PROJECTION

Where you could be in 30 days

68

Today

83

30 days

68/100

Projected

83/100

This projection is based on your current pattern. Scores are recalculated from your actual assessment answers — this is an estimate based on typical improvement rates for your profile type.

Daily fermented food habit

Prebiotic vegetable at every meal

Consistent meal timing

WHERE YOU STAND

Strengths & opportunities

Your three biggest strengths, and the three areas with the most growth potential.

✓ **STRENGTH**

Strong plant variety

You consistently eat a wide range of plant foods across the week. Diversity is the single most important driver of a healthy microbiome, and you're already doing this well.

✓ **STRENGTH**

Consistent meal timing

Your meals follow a relatively predictable daily rhythm. This supports your gut's circadian biology and reduces the inflammatory stress caused by irregular eating patterns.

✓ **STRENGTH**

Fibre awareness

You're already eating fibre-rich foods as a regular part of your diet. This feeds the beneficial bacteria in your colon and supports the production of short-chain fatty acids — key for gut lining health.

→ **OPPORTUNITY**

Fermented food frequency

You rarely or never include fermented foods in your diet. This is the most direct way to introduce beneficial bacteria — even one serving of kefir, kimchi, or live yoghurt daily can shift your Probiotics score significantly.

→ **OPPORTUNITY**

Probiotic variety

When you do eat fermented foods, you tend to rely on one type. Different fermented foods contain different bacterial strains — variety here matters as much as consistency.

→ **OPPORTUNITY**

Post-meal rest habits

Your answers suggest you often move quickly after eating or eat in high-stress situations. The gut needs a brief period of parasympathetic activity

after meals to optimise
digestion and absorption.

— YOUR KEY INSIGHT

The single biggest discovery

KEY FINDING

“Your plant diversity is a genuine foundation — fermented foods are your single biggest lever.”

Most people with a Probiotics score below 50 also score low on Prebiotics, which makes the fix harder and slower. You don't have that problem. You already eat the plant foods that create the environment for beneficial bacteria to thrive — you just need to start introducing them. The effect of adding fermented foods to an already fibre-rich diet is amplified compared to someone starting from zero. You're in a particularly strong position to see rapid improvement.

“

Your gut system is more responsive to change than most people realise. The right inputs, consistently applied, produce results that are both measurable and felt.

EatoBiotics Research

— DEEP INSIGHT —

Your food system in full

A complete picture of how your three scores interact — and what that means for your biology.

HOW YOUR THREE SYSTEMS CONNECT

What your scores reveal is a food system that's doing the right things structurally but missing a key biological input. Think of your gut like a garden: you're watering regularly and the soil is in good condition (Prebiotics + Postbiotics), but you haven't been planting seeds (Probiotics). The structure is there — the flora just needs to be populated.

This pattern is more common than you might think, especially in people who eat healthily but have grown up in cultures or households where fermented foods aren't a staple. It's not a sign of poor habits overall — it's a specific blind spot. The encouraging truth is that this is the easiest gap to close. Unlike fibre intake or meal timing (which require sustained habit change), fermented foods can be added as a simple daily addition to what you already eat.

THE BIOLOGY BEHIND YOUR SCORES

The Gut– Brain Highway

The vagus nerve carries **80% of signals upward** — from gut to brain, not the other way. The quality of your microbiome determines the

Your Microbiome by Numbers

100 trillion bacteria live in your gut — more than the cells in your entire body. Diversity is the single most important metric

Why Your Probiotics Gap Matters

At 45, this is your most correctable score — and the one that creates a bottleneck for everything else. Targeted dietary change here

quality of those signals.

for long-term health.

produces the highest return across all three pillars.

WHAT YOU'LL NOTICE AND WHEN

Your change timeline

DAYS 1–7

First effects

- Digestive rhythm begins to improve
- Reduced bloating after meals
- Slightly better energy on waking

WEEKS 2–4

Microbiome shift

- Measurable bacterial diversity increase
- Energy levels stabilise across the day
- Fewer cravings for ultra-processed foods

MONTH 2+

Brain-gut recalibration

- Mood baseline shifts noticeably
- Sleep depth and onset improves
- Sharper focus and mental clarity

YOUR STARTER PLAN

7-day action plan

One focused action for each day of your first week. Simple, specific, achievable.

1

MONDAY

Add 150ml of plain kefir or live-culture yoghurt to your breakfast

2

TUESDAY

Include a prebiotic vegetable at lunch — garlic, onion, leek, or asparagus

3

WEDNESDAY

Try a tablespoon of kimchi or sauerkraut alongside your evening meal

4

THURSDAY

Eat a mixed legume dish — lentil soup, chickpea salad, or similar

5

FRIDAY

Replace one processed snack with a handful of mixed nuts and seeds

6

SATURDAY

Cook a meal using miso paste — miso soup, miso-glazed salmon, or a miso dressing

7

SUNDAY

Sit down for your meals
without screens. Give your gut
10 quiet minutes to digest

30 days

**for targeted
diet changes to
measurably
shift your
microbiome**

Clinical research
consistently shows
measurable changes in
gut bacterial diversity
within 3–4 weeks of
applying targeted dietary
changes. Your plan below
is built precisely around
this window.

30-DAY ROADMAP

Your month of change

Four themed weeks, each building on the last. Every action is
specific and achievable.

1

WEEK 1

Probiotic Foundation

Introduce your first two fermented foods consistently

- 1 Add kefir or live yoghurt to breakfast every day
- 2 Include sauerkraut or kimchi alongside one meal per day
- 3 Eat a prebiotic vegetable (garlic, onion, leek, asparagus) every day
- 4 Log how you feel — energy, digestion, mood — in a simple note

2

WEEK 2

Deepen the Variety

Add more fermented food types and expand your prebiotic range

- 1 Try a new fermented food you haven't eaten before (tempeh, miso, kombucha)
- 2 Increase your legume intake to 4+ servings this week
- 3 Add Jerusalem artichoke or chicory root to two meals
- 4 Start sitting down for meals without screens at least once a day

3

WEEK 3

Build the Rhythm

Establish consistent daily habits and support your Postbiotics pillar

- 1 Set a consistent daily eating window — try 8am–7pm
- 2 Add a 10-minute walk after your largest meal every day
- 3 Eat fermented foods at breakfast and dinner to cover the full day
- 4 Reduce ultra-processed foods to fewer than 3 servings this week

4

WEEK 4

Optimise & Reflect

Consolidate the changes and prepare to retest

- 1 Maintain all habits from weeks 1–3
- 2 Add one entirely new plant food you've never eaten before
- 3 Review your notes from week 1 — track any changes in energy or digestion

4 Take the EatoBiotics assessment again to see how your score has shifted

FOOD PRESCRIPTION

5 foods chosen specifically for you

Based on your pillar scores, these five foods will have the highest impact on your gut system. Each one is chosen for a specific biological reason — not general health advice.

YOUR 5 FOODS AT A GLANCE

Kefir

7×/wk

Sauerkraut

4×/wk

**Jerusalem
Artichoke**

3×/wk

Chickpeas

4×/wk

Miso

5×/wk

Kefir

#1 priority food

Pillars boosted

Pre

Pro

Pos

Weekly target

7× per week

KEY COMPOUND 30–50 bacterial strains + yeasts

Kefir contains 30–50 strains of beneficial bacteria and yeasts — far more than standard probiotic supplements. Given your low Probiotics score, this is your highest-impact starting food.

How to use: Drink 150–200ml plain (unsweetened) kefir at breakfast or as a mid-morning snack. Goat's milk kefir is gentler if you're new to it.

Sauerkraut

#2 priority food

Pillars boosted

Pre

Pro

Pos

Weekly target

4× per week

KEY COMPOUND *Lactobacillus plantarum*

Live sauerkraut (unpasteurised, from the fridge) is one of the richest sources of *Lactobacillus* strains. It also supports stomach acid production, which complements your Postbiotics score.

How to use: Start with 1 tablespoon alongside meals, 3–4 times a week. Look for refrigerated, unpasteurised sauerkraut — the jarred shelf-stable versions are heat-treated and contain no live cultures.

Jerusalem Artichoke

#3 priority food

Pillars boosted

Pre Pro Pos

Weekly target

3× per week

KEY COMPOUND Inulin (high-FOS)

One of the highest-inulin vegetables available. Inulin is a prebiotic fibre that specifically feeds Bifidobacterium — the bacteria most strongly associated with gut health and mood support.

How to use: Roast or steam and add to salads or grain bowls. Start with a small portion (50g) as inulin can cause bloating until your gut adapts — increase gradually over 2–3 weeks.

Chickpeas

#4 priority food

Pillars boosted

Pre

Pro

Pos

Weekly target

4× per week

KEY COMPOUND Resistant starch + fermentable fibre

A versatile prebiotic powerhouse. Chickpeas contain resistant starch and fermentable fibre that feed the butyrate-producing bacteria your gut lining depends on.

How to use: Use in salads, curries, or roast them for a snack. Canned chickpeas are fine — rinse well. Aim for 3–4 servings per week.

Miso

#5 priority food

Pillars boosted

Pre

Pro

Pos

Weekly target

5× per week

KEY COMPOUND *Aspergillus oryzae* + lactic acid bacteria

Miso is a fermented soybean paste containing beneficial *Aspergillus oryzae* and lactic acid bacteria. It also provides glutamate, which supports the gut lining.

How to use: Dissolve a teaspoon in warm (not boiling) water for a quick miso broth, or use as a marinade or dressing base. Don't boil it — heat destroys the live cultures.

— YOUR COMPLETE WEEKLY SHOPPING LIST

A full gut health shopping guide — your 5 priority picks are highlighted within it. Built around all three biotics, designed to be your standing weekly list.

Weekly Gut Health Shop

31 items across 5 categories

★ 5 PRIORITY PICKS

★ YOUR PRIORITY PICKS FROM THIS REPORT

Kefir 7×/wk

Sauerkraut 4×/wk

Jerusalem Artichoke 3×/wk

Chickpeas 4×/wk

Miso 5×/wk

FERMENTED & LIVE CULTURES

Probiotics

Plain live-culture yoghurt

Full-fat, check label for 'live active cultures'

Kefir

Dairy or goat's milk, plain unsweetened

PRIORITY

Sauerkraut

Refrigerated, unpasteurised only — not jarred shelf-stable

PRIORITY

Kimchi

Refrigerated, traditional ferment

Miso paste

White or brown — add after cooking, never boil

PRIORITY

Tempeh

Firm fermented soy — high protein, mild flavour

Kombucha

Low sugar varieties under 5g per 100ml

PREBIOTIC PRODUCE

Prebiotics

Garlic

Use as a base for everything cooked — 2 cloves per dish

Onions & shallots

Raw has the strongest prebiotic effect

Leeks

High in inulin fructans, mild flavour

Asparagus

In season spring — peak prebiotic content

Jerusalem artichoke

Highest inulin content of any common vegetable

PRIORITY

Banana

Slightly underripe for maximum resistant starch

- ☐ Chicory / endive
Most concentrated inulin source — great in salads

POLYPHENOL-RICH PRODUCE

Prebiotics

- ☐ Blueberries
Fresh or frozen — nutritionally equivalent, frozen cheaper
- ☐ Spinach
60–80g fresh, wilts significantly when cooked
- ☐ Broccoli
Lightly steamed preserves sulforaphane content
- ☐ Red cabbage
Raw in slaws — rich in anthocyanins
- ☐ Walnuts
Raw, not roasted — heat degrades the ALA content
- ☐ Dark chocolate (70%+)
20–30g daily — highest polyphenol density of any food
- ☐ Pomegranate seeds
Ellagitannins converted to urolithins by gut bacteria

WHOLEGRAINS & LEGUMES

Prebiotics

- ☐ Rolled oats
Slow-cooked over instant — more beta-glucan intact
- ☐ Lentils
Red dissolve into sauces, green/black hold shape

Chickpeas

★ PRIORITY

Canned is fine — rinse thoroughly before use

- ☐ Black beans

Highest resistant starch of common legumes

- ☐ Barley
Pearl or pot — outstanding beta-glucan content
- ☐ Quinoa
Complete protein plus prebiotic fibre

PROTEINS & HEALTHY FATS

Postbiotics

- ☐ Eggs
2 per serving, poached or soft-boiled preserves most nutrients
- ☐ Salmon / mackerel / sardines
Oily fish 3× per week — DHA for brain and gut lining
- ☐ Mixed seeds
Flax, chia, pumpkin — omega-3 and zinc sources
- ☐ Extra virgin olive oil
Polyphenols in EVOO directly feed beneficial bacteria

This list evolves in your account

Once you have an account, your shopping list updates automatically — rotating with the seasons for peak nutrition, adding new foods as your gut score improves, and adjusting quantities for your household size.

POWER COMBINATIONS

These food pairings produce significantly greater benefits than each food alone — a concept known as synbiotics.

Kefir + Jerusalem Artichoke

Synbiotic pairing

Probiotic + prebiotic — a clinical synbiotic pairing. The bacteria in kefir feed on the inulin in artichoke, multiplying and diversifying your microbiome far beyond what either food achieves alone.

Chickpeas + Sauerkraut

Synbiotic pairing

Resistant starch + live cultures — chickpeas provide the fermentable fuel; sauerkraut supplies the bacteria to ferment it. Together they maximise butyrate production for gut lining repair.

THE THREE THINGS THIS REPORT HAS SHOWN YOU

 72

PREBIOTICS

Your Prebiotics score of 72 is a genuine strength — protect and build on it.

 45

PROBIOTICS

Your Probiotics score of 45 is your biggest opportunity — this is where your effort should focus first.

 78

POSTBIOTICS

Your Postbiotics score of 78 is a genuine strength — protect and build on it.

OUR ASSESSMENT

Your starting point is genuinely strong. A score of 68 with high Prebiotics and Postbiotics scores means you're not starting from scratch — you're filling a specific gap in an otherwise functional system. The 30-day roadmap above is designed to close that gap methodically, without overhauling everything you're already doing well. Focus on the Probiotics pillar first. Your gut will respond faster than you expect.

YOUR THREE COMMITMENTS STARTING TODAY

01 Start with one change

Pick the single highest-impact action from your 7-day plan and do it today. Don't wait for the perfect moment — one action builds the habit loop that makes the rest easier.

02 Stay consistent for 30 days

The gut microbiome doesn't respond to occasional efforts. Consistency across 30 days is what produces the measurable shift your projection is based on. Small daily additions beat occasional big efforts every time.

03 Retest after 30 days

Your score is a baseline, not a verdict. Retaking the assessment after applying this plan gives you a real

measurement of what changed — and a new starting point to build from.

DAY 30

Mark your retest date

Set a reminder for 30 days from today. Gut microbiome composition can shift measurably in 3–4 weeks with consistent dietary changes. Your retake will show you exactly what moved — and where to focus next.

Energy

Sleep

Digestion

Mood

Focus

— track these daily
